

Classroom Activity

10 Big Question: How did life evolve on Earth?

Volcanoes, fossils and flowers

Either individually or in a group, choose one of the following questions to research. Use the article, useful websites and videos as a starting point and find more information in the library and on the internet. Remember to record all of your sources and evaluate them for reliability.

Choose from the following questions:

- What different types of land features are caused by volcanic activity and how are they formed?
- What are the different ways that plant and animal fossils can be formed?
- What are some of the different methods flowers use for pollination?

Once you have found enough information, use what you have learned to create a poster answering the question you were researching, including images and diagrams where necessary. As an extension activity, present this poster to the rest of your class.
